

The W2 Tillett car seat is either supplied as you would buy a kart shell or with a moulded back frame. If bought as a shell it must have brackets made in order to fit it to various vehicles. These seats can be ordered in lightweight carbon KEVLAR® versions as well as the usual GRP. They can also be ordered with or without covering. A half covered example is ideal for open top cars. There is also an Dinamica suede panel set option. Seat belt harness holes are a no cost option and you can select a hip and crotch or just the hip holes.

Seat to the left and below shown with optional back frame. It weighs 3.3 kg in GRP.

Without the back frame the weight is 2.4 kg and 1.5 kg in carbon Kevlar.

Seat above is a GRP shell with edges trimmed for reducing the width down to 41.5 cm and also shows the 4 ideal mounting points.
